

Problem Statement

Engineering teams are adopting AI coding tools at an accelerating pace — Claude Code, Cursor, Codex CLI, Gemini CLI, and others. Yet today, there is no centralised way for teams or managers to answer three basic questions:

- How much are we spending on AI tools each month?
- Which tools and models are actually being used, and by whom?
- Are costs growing out of control, and will we know before the invoice arrives?

As a result:

- Costs become unpredictable
- Governance and compliance are weak
- Leadership lacks decision-making visibility

Without visibility, teams routinely overspend, duplicate subscriptions, and cannot justify AI tooling budgets to leadership. This product offer a centralized platform that helps teams track, understand, and control their usage of AI coding tools such as Claude, Cursor, Codex CLI, Gemini, etc.

It provides visibility into:

- Token consumption
- Cost incurred
- AI conversations and usage patterns

This allows organizations to manage AI adoption responsibly and cost-effectively.

Target Users

Primary Users

CTO / Project Manager / Team Lead

- Needs to track total AI spend across the team.
- Wants to see which tools are used most and justify costs to leadership / finance.
- Needs to be alerted if spend crosses a threshold before the billing cycle ends.

Developer

- Uses one or more AI coding tools
- Wants to understand their own usage

Secondary User

Finance

- Needs monthly reports to reconcile AI spend against budgets
- Wants downloadable data (CSV) to import into existing finance workflows

Suggested User Flows

Onboarding

- User signs up with email
- Creates an organisation (or is invited to join one)
- Navigates to Integrations and selects their AI tool (e.g. Claude Code, Codex)
- Copies a generated API key and pastes it into their tool's config setup
- First telemetry event trigger; user sees their first usage data on the dashboard

Monitoring Dashboard for User

- User opens the dashboard
- Views today's cost, token usage, and model breakdown at a glance
- Filters by date range, tool, or model
- Exports a CSV for further analysis (optional)

Team Management

- Owner Account navigates to Users
- Invites a colleague via email
- Assigns a role: Admin, Manager, or Developer
- Invitee accepts email invite and lands on the shared organisation dashboard
- Owner can remove or change roles at any time

Monthly Report (Admin / Manager)

- Manager navigates to Reports
- Selects date range (last month)
- Reviews weekly digest summary: total cost, top model, top tool
- Downloads the report as CSV or views it in-app

Some known Edge Cases

User & Access Edge Cases

- User invited but not accepted yet
- An invited user already has an account under a different organisation
- An Owner removes themselves from the organisation — the system must prevent this unless there is at least one other Owner, to avoid orphaned organisations.
- An API key is leaked or compromised — users must be able to revoke and replace a key instantly without losing historical data.
- Role mismatch (e.g., Developer trying Owner action)
- Expired or revoked keys still being used

Billing & Plan Edge Cases

- A team on the Free plan exceeds the seat limit after an invite — the invite should be blocked with a clear prompt to upgrade, not silently fail.
- An organisation cancels mid-month — their data should remain accessible in read-only mode for a grace period (e.g. 28 days) before deletion.

Reporting & Alerts Edge Cases

- An alert fires but the email bounces
- No usage events have been recorded yet (new account) — dashboards and reports should show an empty state with helpful onboarding prompts, not broken charts.
- Performance of dashboard with large datasets
- Export limits (CSV size constraints)

Assumptions

- AI tools can send telemetry via API key integration
- Organizations are comfortable adding tracking layer
- Users prefer simple dashboards over complex analytics
